Carbon Conductive Tapes, Double Coated						
These carbon tapes are conductive and may be used conveniently for scanning electron microscopy or EDS applications. The purity of this tape is identical to the PELCO Tabs™; only very small impurities of Al and Si may be found. Both sides of the tape have a thick conductive adhesive (conductive inner film is 35µm and the adhesive is 45µm on each side for a total of 125µm [5 mils]) with a white liner. The double adhesive and conductive design permits quick mounting of samples without using liquid or colloidal adhesives. The tape is relatively solid and non-porous and does not absorb small samples. The variety of widths affords efficient application to various specimen mount surface sizes. Thickness is 0.16mm. Available in six widths. Can be used down to -20°C (-4°F) and temperature maximum is 60°C (140°F). Available in 5, 8, 12, 20, 25, and 50mm W x 20m L (0.19, 0.31, 0.47, 0.79, 0.98, and 1.96" x 21.8 yd). Core diameter is 76mm (3").

Product Specification:

1) Agate is a microcrystalline variety of silica, chiefly chalcedony, characterised by its fineness of grain and brightness of color. Although agates may be found in various kinds of rock, they are classically associated with volcanic rocks and can be common in certain metamorphic rocks.

2) Most agates occur as nodules in volcanic rocks or ancient lavas where they represent cavities originally produced by the disengagement of volatiles in the molten mass which were then filled, sholly or partially, by siliceous matter deposited in regular layers upon the walls. such agates, when cut transversely, exhibit a succession of parallel lines, often of extreme tenuity giving a banded appearance to the section. Such stones are known as banded agate, riband agate and striped agate.

3) Physical Properties :

Color White to grey.

Mohs scale hardness 6.5-7

Luster Waxy

Diaphaneity Translucent

Density (gm/cc) 2.58-2.64
